## **NOMENCLATURE**

| <i>a</i> , <i>b</i> , <i>c</i> , <i>d</i> | <ul> <li>Failure parameters</li> </ul>  |     |
|---|---|-----|
| $\boldsymbol{A}$                          | - Area of pipe, m <sup>2</sup>  |     |
| $A_{wall}$                                | <ul> <li>Cross-section area of the pipe wall, m<sup>2</sup></li> </ul>                                |     |
| $b_w$                                     | <ul> <li>Cross-section width, m</li> </ul>  |     |
| $d_p$                                     | <ul> <li>Inner diameter of the pipe, m</li> </ul>   |     |
| $D_p$                                     | <ul> <li>Outer diameter of the pipe, m</li> </ul>   |     |
| $D_{eng}$                                 | <ul> <li>Equivalent diameter of the engine, m</li> </ul>  |     |
| D   | <ul> <li>Reference strain-rate, 1/s</li> </ul>  |     |
| $E_{red}$                                 | <ul> <li>Reduced modules of elasticity, MPa</li> </ul>  |     |
| $E_c$                                     | <ul> <li>Initial elasticity of the concrete, MPa</li> </ul>   |     |
| $E_s$                                     | Initial elasticity of the steal, MPa  |     |
| $f_c$                                     | <ul> <li>Uniaxial compressive strength of concrete, MPa</li> </ul>                                    |     |
| $f_t$                                     | <ul> <li>Uniaxial tensile strength of concrete, MPa</li> </ul>  |     |
| $f_{bc}$                                  | - Equal biaxial compressive strength of concrete  | е,  |
|   | MPa   |     |
| $f_{pc}, f_{cc}$                          | - Combined triaxial compression of concrete, MPa  |     |
| $f_{\mathrm{y}}$                          | Yield strength of reinforcement, MPa  |     |
| $f_{dc}$                                  | <ul> <li>Dynamic compressive strength, MPa</li> </ul>   |     |
| $f_{cs}$                                  | <ul> <li>Static compressive strength, MPa</li> </ul>  |     |
| $f_{dt}$                                  | <ul> <li>Dynamic tensile strength, MPa</li> </ul>   |     |
| $f_{ts}$                                  | <ul> <li>Static tensile strength, MPa</li> </ul>  |     |
| $F_c$                                     | <ul> <li>Load contribution from aircraft crushing strength</li> <li>N</li> </ul>                      | 1,  |
| $f_{iI}^{\;\;int}$                        | <ul> <li>Internal nodal forces of node I in the i-th direction</li> </ul>                             | n   |
| Jil                                       | N   | .1, |
| $f_{iI}^{\;ext}$                          | <ul> <li>External nodal forces of node I in the i-t</li> </ul>  | h   |
| J iI                                      | direction, N  | 11  |
| $h_{ m o}$                                | <ul><li>Thickness of the wall, m</li></ul>  |     |
| $\overset{n_{\mathrm{o}}}{h}$             | <ul> <li>Thickness of the wan, in</li> <li>Thickness of the spacing of reinforcement layer</li> </ul> | rc  |
| п   | in the respective directions, m   |     |
| $h_1$                                     | <ul> <li>Thickness of the reinforcement layer, m</li> </ul>   |     |
| I   | <ul> <li>Moment of inertia, m<sup>4</sup></li> </ul>  |     |
|   | <ul> <li>Stress invariants, MPa, (MPa)<sup>2</sup></li> </ul>   |     |
| $I_1, J_2$                                | - Suess invariants, wif a, (wif a)  |     |

l – Length of the straight pipe, m

 $m_{il}$  – Diagonal mass matrix of node I in the i-th direction

*M* – Mass of the missile, kg

 $M_2$  - Bending moment with respect to axis 2, N-m

 $M_3$  – Bending moment with respect to axis 3, N-m

*n* – Step number

P – Axial force, N

 $p_k$  - Pressure at the break location, Pa

p<sub>a</sub> – Outside (atmospheric) pressure, Pa

 $p_{wall}$  - Pressure straight after the break location, Pa

p – Reinforcement ratio

*q* – Steel strain-rate amplitude parameter

 $Q_x$  – Reaction force, N

 $S_2$  – Sectional modulus with respect to axis 2, m<sup>3</sup>

 $S_3$  - Sectional modulus with respect to axis 3, m<sup>3</sup>

t Wall thickness, m

*t<sub>c</sub>* – Thickness of reinforcement with prevailing compression, m

 $t_p$  – Minimum wall thickness to prevent perforation, m

 $t_{pd}$  – Minimum design thickness to prevent perforation, m

 $t_s$  – Minimum wall thickness to prevent scabbing, m

 $t_{sd}$  – Minimum design thickness to prevent scabbing, m

 $t_t$  – Thickness of reinforcement with prevailing tension, m

 $\Delta t$  – Time increment, s

U – Reference velocity, m/s

 $u_{iI}$  - Nodal displacement of node I in the i-th direction, m

 $\hat{u}_{iI}$  - Nodal velocity of node I in the i-th direction, m/s

 $\ddot{u}_{iI}$  - Nodal acceleration of node I in the i-th direction, m/s<sup>2</sup>

v – Velocity of the uncrushed part of the plane relative to the wall, m/s

V – Velocity of the engine, m/s

 $w_k$  – Fluid velocity at the break location, m/s

Thickness of a concrete layer under compression in the corresponding part of the reinforcement, m.

## **Greek letters**

 $\alpha$ ,  $\alpha_{fy}$ ,  $\alpha_{fu}$  – Parameters

 $\beta$ ,  $\delta$  – Parameters

 $\dot{\varepsilon}$  – Strain-rate, 1/s

 $\dot{\varepsilon}_s$  – Static strain-rate, 1/s

 $\mu$  – Mass per unit length, kg/m

 $\rho_k$  - Fluid density at the break location, kg/m<sup>3</sup>

 $\sigma_a$  – Axial stress, MPa

 $\sigma_{b2/3}$  – Bending stress with respect to axis 2 and 3, MPa

 $\sigma_{dvn}$  – Dynamic flow stress, MPa

 $\sigma_1$  – Maximum principal stress, MPa

 $\sigma_{\rm y}$  – Normal stress, MPa

 $\sigma_{static}$  – Static flow stress, MPa

 $\sigma_{worst}$  – Worst stress, MPa

 $\tau_u$  – Transverse shear failure, MPa

## **Abbreviations**

ALS – Accident Localisation System

BSRC – Bottom Steam Reception Chamber

BWR – Boiling Water Reactor

CFAIL - Concrete Failure

DIF – Dynamic Increase Factors

DS – Deterministic Software

FC - Fuel Channel

FE – Finite Element

FOSM - First Order-Second Moment

FORM – First Order Reliability Method

GDH – Group Distribution Header

IS – Importance Sampling,

LOCA - Loss of Coolant Accident

LWC - Lower Water Communication

MCC - Main Cooling Circuit

MCP – Main Circulation Pump

MCS – Monte Carlo Simulation

MDBA – Maximum Design Basis Accident

MSRV – Main Steam Relief Valve

NPP - Nuclear Power Plant

PS – Probabilistic Software

PWR - Pressurized Water Reactor

RBMK - Russian abbreviation for "Large-power channel-

type reactor"

RC – Reinforced Concrete RS – Response Surface

SDH – Steam Distribution Header SDD – Steam Distribution Device.
