

## SUBJECT INDEX

- Anisotropy, 12, 18, 19  
curvilinear, 19  
deformation, 74  
principal axes of, 26, 27  
unified matrices, 27
- Boundary  
static conditions, 47  
-value equations, 47
- Bravais lattice, 13, 14, 16
- Brittle fracture, 157, 158
- Burgers  
contour, 169  
vector, 169
- Christoffel symbols, 234
- Coefficient  
compliance, 27  
singularity, 161, 166  
stress intensity, 161, 162  
symmetric Poisson, 31
- Components  
contravariant, 231  
covariant, 231  
mixed, 231  
physical, 235, 241
- Condition(s)  
boundary, 47  
incompressibility, 61, 82  
inextensibility, 78  
reciprocity, 230  
regularity, 201  
transition, 50, 52, 53, 57, 58, 60, 65,  
92, 100
- Coordinates  
curvilinear, 229  
normal, 237  
orthogonal, 235
- Cords (see Filaments)
- Covariant differentiation, 234
- Cracks, 158  
“linear,” 161–164  
mixed type, 164  
opening mode (mode I), 161, 162,  
165, 166  
sliding mode (mode II), 163, 166
- Criterion  
global convexity, 214  
local convexity, 214, 219  
monotonicity, 212  
ordering, 213  
stability, 213, 219
- Crystal  
classes, 16–18  
intrinsic characteristics, 188  
lattice, 12, 13, 17, 18  
systems, 14  
unified matrices, 27, 187
- Deformation gradient, 45
- Deviator plane, 201
- Disclination  
wedge, 169, 172  
torsion, 169
- Dislocation  
edge, 170, 172  
linear, 168  
screw, 169–171  
strain, 168  
stress, 169  
Volterra’s, 167
- Edge effect, 171
- Elastic potential (see Strain-energy density function)
- Elastic constants, 31

- Energy**  
 additional, 215  
 pairs, 205, 206, 216, 218, 219,  
 224, 225  
 strain, 31, 49, 61
- Equations**  
 boundary-value, 47  
 equilibrium (motion), 47, 76, 86, 106
- Filaments (cords)**  
 inextensible, 78  
 slightly extensible, 74
- Invariant(s)**  
 base, 200  
 large deformation, 221, 223  
 space, 200
- Isotropy**, 12, 26, 34, 36
- Lamé parameters**, 230
- Law**  
 Hooke's, 31, 32, 49, 50, 54  
 of elasticity, 48, 49, 52, 62, 77,  
 79, 89, 145, 158, 189
- Linear rigid inclusion**, 157, 160, 161
- Load**  
 dead, 76  
 "following," 76, 159, 163  
 parametric, 163
- Lune**, 161
- Mass force**, 47, 76
- Material**  
 Bartenev-Khazanovich, 62, 107, 114  
 closest, 186  
 elastic, 208, 213  
 hyperelastic, 209  
 incompressible, 32, 48, 49  
 isotropic, 36, 59, 61  
 Mooney, 62  
 neo-Hookean, 62, 107, 111  
 neo-Hookean type, 62, 64  
 orthotropic, 33, 50, 142  
 quasi-elastic, 209, 210  
 simple, 208  
 stability postulate, 209, 217  
 standard, 54, 58, 61  
 three-constant, 62  
 transversely anisotropic, 18
- transversally isotropic, 34, 55  
 two-constant, 62  
 weakly compressible, 64, 146, 176
- Modulus**  
 generalized Young's, 31  
 normal, 211  
 "unused" ranges, 189
- Narrowest bounds, 30
- Neumann's principle**, 19
- Orthotropy**, 33
- Plane problems**  
 basic equations, 122, 140  
 complex variable method, 122, 131  
 elasticity law, 143-145, 147  
 elliptic hole, 135, 154, 155  
 linear approach, 122  
 nonlinear approach, 140  
 orthotropic material, 123, 127, 129  
 physically linear material, 148  
 plane strain, 122, 124, 126, 127  
 plane stress, 122, 124, 125  
 rectilinear cut, 135, 137  
 stress function, 126  
 transversely isotropic material, 143
- Poisson (symmetric) coefficients**,  
 31, 189
- Polar decomposition**, 45
- Ratio**  
 area, 100  
 extension, 45, 225-227  
 volume, 46
- Reinforcement**  
 conic shock-absorber, 114, 116  
 cylindrical plate, 111, 119, 120  
 cylindrical shells, 112, 113  
 elastomers, 108  
 middle surface, 108, 110-112, 114,  
 119, 120, 122  
 shells, 108  
 through the thickness, 117, 119
- Shell problems**  
 boundary force values, 83  
 strain-energy density functions, 100  
 deformation, 81, 82

- double moment tensor, 85  
 double stress resultant tensor, 85  
 equations of motion (equilibrium),  
     87, 88, 106  
 incompressibility condition, 82  
 isotropic, 91, 98  
 Kirchhoff's hypothesis, 81, 89  
 law of elasticity, 89, 100  
 middle surface, 238  
 orthotropic, 93  
 of revolution, 103  
 stress resultants and moments,  
     83–86, 105  
 thin, 238  
 transition condition, 92, 100  
 transversal force, 85, 105  
 transversally isotropic, 96, 100  
 Singular line, 169  
 Space  
     invariant, 201  
     six-dimensional, 204  
 Strain-energy density function, 31, 49,  
     51, 59, 61  
 Strain  
     extensional, 225  
     plane, 122, 126, 140  
     shearing, 30, 32  
     true (logarithmic), 224  
     volumetric, 26, 32, 221–223  
 Stress  
     conventional (Biot), 48, 141, 148,  
       158, 159, 165, 173, 221, 225  
     nominal, 47, 140, 148  
     plane, 122, 124, 140  
     preliminary, 150  
     true (Cauchy), 46, 159, 224  
     ultimate, 225  
 Summation convention, ix  
 Surface  
     middle, 238  
     normal, 241  
     theory, 237  
 Symmetry  
     group, 4–6, 12  
     of finite bodies, 1, 2  
     order of, 4  
     transformations of, 2, 3  
 Tensor(s)  
     Almansi strain, 206  
     bench mark, 194  
     bulk modulus, 26  
     Cauchy–Lagrange strain, 46  
     classical t. functions, 203, 204  
     coaxial, 199  
     conjugate, 236  
     discriminant, 232  
     double, 47  
     extension ratio, 45, 221, 225  
     gradient of invariant t., 200  
     Green's strain, 206  
     group basis, 180  
     invariant, 182, 184, 186  
     nominal stress, 47  
     rank, 18  
     Rivlin's, 193  
     semisymmetric, 185  
     symmetric Piola–Kirchhoff's, 206  
     true (Cauchy), 46, 206  
     unitary, 232  
     t. function of vector type, 200  
     t. multiplication table, 190  
     t. objective rates, 205, 207, 208  
     t. representations, 201  
     t. with a common axis, 198  
 Textures, 18  
 Transversal anisotropy, 18  
 Transversal isotropy, 36  
 Uniform membrane state, 101  
 Vector  
     basic coordinate, 230  
     Burgers', 169  
     displacement, 46  
     Frank's, 169  
     reciprocal coordinate, 230  
     stress, 46, 47  
     unit coordinate, 230  
     unit normal, 240  
     unit tangential, 240  
     unit tangential normal, 240  
 Volume ratio, 46  
 Work conjugates, 205, 216–219
