INDEX

Ascending twisted flow, 211
    development of the bottom part of, 218–220
    modeling of, 211
    formation of, 211–213
    steady-state flow in the bottom part of, 220–224

Basic definitions, 2, 3
    cyclone, 2
    extratropical cyclone, 2
    hurricane, 2, 3
    hurricane whirlwinds, 3
    storm, 3
    tropical cyclone, 2
    vortex, 3
    whirlwind, 3
    wind speed (force), 3
Basic equations, 165–171
    continuity, 165, 166
    Navier–Stokes, 166, 167
    vorticity, 167–171
Beafort wind speed (force) scale, 4, 5
Bernoulli equation, 193

Coriolis force, 174–177, 212
    cause of the, 174, 175
    impact on horizontal motion, 185–189
    impact on vertical motion, 178–185
    system of equations with account for, 213–218
Coriolis parameter, 198–200

Damage indicators (DI)
description, 32
list of, 31
photo of a typical, 34–36
Degrees of damage (DOD), 33–37

Earth atmosphere
composition and structure, 46–48
indifferent equilibrium, 50, 52
pressure field, 48, 49
steady equilibrium, 50, 51
stratosphere, 47, 48
troposphere, 47
unsteady equilibrium, 50, 51
vertical balance, 49–52
Elements of hydrostatics, 171–174
dropping liquid equilibrium in a rotating vessel, 171, 172
dry-adiabatic gradient, 173, 174
equilibrium of gases, 173, 174
Enhanced Fujita scale (EF scale), 30–40
Euler equation, 214
Extratropical cyclones (anticyclones), 45
atmospheric precipitations in, 60, 61
development stages of, 56, 57
heat (cold) transfer by, 63–65
hurricane winds in, 61–63
frequency and sites of generation of, 58–60
natural phenomena accompanying, 60–-63
properties of, 56–60
specific features of air movement, 57, 58
typical pressure values, 60

Frontal zones, 52, 53
Fujita scale (F scale), 22, 25–30, 38

Hurricane, 6
Katrina, 12-18
Saffir–Simpson wind scale, 6, 7
the 2005 season, 6, 9–12

tornados, 18–25

Killer tornados
distribution by months, 131–133
rating of ten the most powerful, 135

Mathematical modeling of tornados, 191
analysis of vortex instability, 198–202
analytical solution of the Navier–Stokes equations, 205–210
ascending twisted flow, 211–224
exact solution for tornados, 195, 196
modeling the ascending twisted flow, 211–213
numerical simulation of tornados, 224–228
simple analytical model, 192–197
stratified tornados, 196, 197
very simple solution for tornados, 192–195
Most known tornado
Amite/Pine/Purvis, 140
Delphos, 122–125
Flint, 140
Gainsville, 138, 139
in Central Regions of Russia, 113–115
in England, 119, 120
in Moscow Region, 111, 112, 115–118
in United States of America, 120–125
in Western Europe, 118–120
Irving, 120–122
Monville, 118, 119
Moscow, 107–111
Natchez, 136
New Richmond, 140
St. Louis/East St.Louis, 136, 137
Three State, 134–136
Tupelo, 137, 138
Waco, 140, 141
Woodward, 138, 140

Navier–Stokes equation, 166, 167, 205, 206
New passive-active protection method advantages, 280–291

effect of aerodynamic increase of the “working” surface, 284, 285
effect of enhanced impact at smaller distances, 288
effect of increasing the relative size of the mesh, 289, 290
effect of protection against debris, 291
effect of rapid and seasonal installation, 291
generation of small-scale turbulence, 280, 284
long-distance interaction, 285–288
small height of the mesh structure, 289
non-use of a solid barrier, 280
New method for tornado control, 263
physical principles and advantages, 280–291

Physical modeling of tornados, 229
air temperature distribution, 237–242
description of the unit, 233, 234
dynamics of vortex structures, 245–247
experimental unit, 230–233
instantaneous velocity field, 259–261
generalization of data, 242, 243
integrated parameters of vortex structures, 243–245
Rayleigh number, 242, 243
Rossby number, 258, 259
thermal conditions, 234, 235
thermal modes, 234, 235
traces of vortex structures, 247–249
twisting parameter, 256
underlying surface temperature distribution, 235–237
visualization of the vortex funnel, 249–256

Rayleigh number, 242, 243
Reynolds number, 205, 206, 285
Rossby number, 160, 161, 258, 259

Saffir–Simpson hurricane scale, 6, 7

Tornado
damage from, 146–148
distributions by the states and months, 126–130
enhanced Fujita scale (EF scale), 30–40
frequency and places of generation, 95

Fujita scale (F scale), 22, 25–30, 38
groups of, 91
lifetime, 93, 94
numerical simulation of, 224–228
path length, 93, 94
possibilities for protection, 141, 148–152
properties of, 91–95
protection against, 148–152
rating by the power, 125, 126
sizes and weight, 94
speed of movement, 93, 94
stages of development, 91, 92
study and forecasting of, 141–146
Tornado clouds
general characterization, 73
horizontal, 77, 78
internal structure, 73–77
shapes and dimensions, 73
towering, 78, 79
Tornado hazardousness
determining, 328, 329
distribution of the states by, 131
evaluation of the area, 315, 316
preliminary evaluation, 316, 317
probabilistic criterion of, 325–328
rating of different states by, 132
recommendations on definition, 321, 322
Tornado shapes
blurred, 88–90
dense, 83–88
Tornado structure
cascade, 81–83
funnel, 79–81
inner cavity, 80
walls, 80, 81
Tornado types
dust, 96–98
fire, 103–106

invisible, 95, 96
snow, 106, 107
waterspout, 98–103
Tropical cyclones, 67–69
conditions of generation, 67
pressure in the center, 68
speed, 67
wind speed, 68

Vortex-mesh interaction, 266–280
basic ideas, 266–270
data generalization, 276–278
elementary turbulent transformer, 269
experimental unit, 266
power of the laboratory generated vortices, 276–278
geometric mesh parameter, 276, 277
schematic illustration, 267, 269, 270
secondary turbulent flow, 269
single-mesh structures, 271–278
two-mesh structures, 278–280
Vortex motion, 153–161
angular velocity, 159–160
azimuthal (tangential) velocity, 157, 158, 193
characteristics, 157–161
circulation, 160, 193
some difinitions, 154–157
streamline, 154
streamtube, 155
systems of coordinates, 154
twisting parameter, 158
vortex line, 155–157
vortex rope, 157
vortex tube, 157
vorticity, 159, 160
Vortex types
dust, 96–98
fire, 103–106
invisible, 95, 96

snow, 106, 107
water, 102, 103
Vortices, 162–165
combined (Rankine), 163–165, 286
elementary data on, 162–165
forced (solid-state rotation), 162, 163
free (potential), 162

Weather fronts, 53–55
occluded, 55
secondary, 55
stationary, 53–55
Winds, 3
Beafort force scale, 4, 5
